I am writing this to apply for the **Software Engineering Intern** position in your **Engineering, AI & Data** in KL . But what sets **Deloitte** apart from other firms I have considered is your commitment to **purpose-led technology work**, the idea that engineering shall always **solve real problems** for real communities not just ship the features . Your focus on business practices align with how I want to spend my engineering career. Combined with Deloitte's reputation for combining established consulting rigor with a modern tech stack such as React, cloud, ML, GenAI, this is the environment that really feels close to me and I believe that I had learn the most while contributing meaningfully to client work.

What actually caught my eye about this position is its scope, It's **not a narrow ML** only role or pure backend role, but a **full stack engineering role** where **AI/ML and software development are treated as one discipline**. The JD's emphasis on systems and technology development, working with technical leads to build, integrate and test systems to meet business requirements, and this matches how I actually work. I've spent the past year building end to end systems where the ML pipeline, the database and the analytics that provides comprehensive representation.

My **final year project, Sentiri**, is a **chat analytics platform** for a **Malaysian autism therapy center** that processes 400+ real WhatsApp conversations through a hybrid topic modeling pipeline I designed from scratch which is combining **XLM-RoBERTa** sentiment analysis with **BERTopic unsupervised clustering** and **supervised seed based keyword mapping**. I built the custom Django admin interface, the database schema and refactored the upload logic into a reusable shared service layer for faster and better testing. Solving real problems with real data taught me that production systems live or die on edge cases. Alongside, this I built **PersonalRAG**, a retrieval Augmented Generation agent using LangChain, ChromaDB, and Groq, which gave me practical experience. Both projects are open-source on my GitHub.

Thank your for your time and consideration. I hope my experience in **AI engineering and full stack systems development** will make a valuable asset to your Deloitte team. I can easily be reached at your convenience by email at nikabdulaqmal@gmail.com or by telephone +60 17-971 6757. I look forward to the opportunity to discuss how I can contribute to your engineering work.

Sincerely,
Nik Abdul Aqmal bin Zunaidi
